ASSIGNMENT 3 - SOLUTIONS

Exercise 1. Suppose we are in $\mathbb{F}_2$. Find

1. $\gcd(x^4+x^2+1, x^2+1)$
2. $\gcd(x^6+x^5+x^3+x+1, x^4+x^2+1)$
3. $\gcd(x^6+x^5+x^3+x+1, x^4+x^3+x+1)$

Solution.
1. 1
2. x^4+x^2+1
3. x^2+x+1

□

Exercise 2. Show that a Reed-Solomon code with 2 message symbols and n codeword symbols is an n times repetition code.

Solution. If we have a 2 message symbols, encoding polynomials are of degree zero (i.e., are constants) and evaluated n times. □

Exercise 3. Construct an $RS(n=4, k=2)$ code. For the construction you may want to consider the irreducible polynomial X^2+X+1 over $\mathbb{F}_2$ and the evaluation points (to be justified) $\alpha_1 = 0$, $\alpha_2 = 1$, $\alpha_3 = x$, $\alpha_4 = x+1 = x^2$.

Solution. Since $n=4$ we need a base field with (at least) 4 elements. So let's choose the base field $\mathbb{F}_4 = \mathbb{F}_2[X]/(X^2+X+1)$ whose elements are thus

$$\{0, 1, x, x+1 = x^2\}.$$

Since $k=2$, the message polynomials are of degree $k-1=1$ and can be written as $f_0 + f_1 x$ with $f_0, f_1 \in \mathbb{F}_4$. Thus the mapping between information symbols and codewords is given by

$$(f_0, f_1) \to (f_0 + f_1\alpha_1, f_0 + f_1\alpha_2, f_0 + f_1\alpha_3, f_0 + f_1\alpha_4).$$

The full mapping is thus

$$\begin{array}{cccccc} 0 & 0 & \to & (0 & 0 & 0 & 0) \\ 0 & 1 & \to & (0 & 1 & x & x+1) \\ 0 & x & \to & (0 & x & x+1 & 1) \\ 0 & x+1 & \to & (0 & x+1 & 1 & x) \\ 1 & 0 & \to & (1 & 1 & 1 & 1) \\ 1 & 1 & \to & (1 & 0 & x+1 & x) \\ 1 & x & \to & (1 & x+1 & x & 0) \\ 1 & x+1 & \to & (1 & x & 0 & x+1) \end{array} \qquad \begin{array}{cccccc} x & 0 & \to & (x & x & x & x) \\ x & 1 & \to & (x & x+1 & 0 & 1) \\ x & x & \to & (x & 0 & 1 & x+1) \\ x & x+1 & \to & (x & 1 & x+1 & 0) \\ x+1 & 0 & \to & (x+1 & x+1 & x+1 & x+1) \\ x+1 & 1 & \to & (x+1 & x & 1 & 0) \\ x+1 & x & \to & (x+1 & 1 & 0 & x) \\ x+1 & x+1 & \to & (x+1 & 0 & x & 1) \end{array}$$

□

Exercise 4. Consider the following mapping from $(\mathbb{F}_q)^k$ to $(\mathbb{F}_q)^{k+1}$. Let $(f_0, f_1, \ldots, f_{k-1})$ be any k-tuple over $\mathbb{F}_q$, and define the polynomial $f(x) = f_0 + f_1 x + \ldots + f_{k-1}x^{k-1}$ of degree less than k. Map $(f_0, f_1, ..., f_{k-1})$ to the $(q+1)$-tuple $(\{f(\alpha_i), \alpha_i \in \mathbb{F}_q\}, f_{k-1})$—i.e., to the RS codeword corresponding to $f(x)$, plus an additional component equal to f_{k-1}.

Show that the $q^k(q+1)$-tuples generated by this mapping as the polynomial $f(z)$ ranges over all q^k polynomials over $\mathbb{F}_q$ of degree $< k$ form a linear $(n = q+1, k, d = n-k+1)$ MDS code over $\mathbb{F}_q$. [Hint:$f(x)$ has degree $< k-1$ if and only if $f_{k-1} = 0$.]

Solution. The code has length $n = q+1$. It is linear because the sum of codewords corresponding to$f(x)$ and $g(x)$ is the codeword corresponding to $f(x) + g(x)$, another polynomial of degree less than k. Its dimension is k because no polynomial other than the zero polynomial maps to the zero $(q+1)$-tuple.

To prove that the minimum weight of any nonzero codeword is $d = n - k + 1$, use the hint and consider the two possible cases for f_{k-1}:

- If $f_{k-1} \neq 0$, then deg$f(x) = k-1$. By the fundamental theorem of algebra, the RS codeword corresponding to $f(x)$ has at most $k-1$ zeroes. Moreover, the f_{k-1} component is nonzero. Thus the number of nonzero components in the code $(q+1)$-tuple is at least $q-(k-1)+1 = n-k+1$.

- If $f_{k-1} = 0$ and $f(x) = 0$, then deg$f(x) \leq k-2$. By the fundamental theorem of algebra, the RS codeword corresponding to $f(x)$ has at most $k-2$ zeroes, so the number of nonzero components in the code $(q+1)$-tuple is at least $q-(k-2) = n-k+1$.

□

Exercise 5. Suppose we want to correct bursts of errors, that is error patterns that affect a certain number of consecutive bits. Suppose we are given an $[n, k]$ RS code over $\mathbb{F}_{2^t}$. Show that this code yields a binary code which can correct any burst of $(\lfloor (n-k) \rfloor / 2 - 1)t$ bits.

Solution. Map each 2^t symbols of $\mathbb{F}_{2^t}$ into t bits. The code can correct up to $(d-1)/2$ symbol errors which translates into an error correction capability of $(\lfloor (d-1)/2 \rfloor - 1)t$ consecutive bits ($\lfloor (d-1)/2 \rfloor t$ if the burst of errors starts at the beginning of a symbol). □
